Project Development Phase

Project Development Phase is the stage where the planned project is actually built and developed according to the requirements and design.

Main Activities:

1. **Coding/Development** – Write the required program or software.
2. **Testing** – Check whether the project works correctly and find errors.
3. **Integration** – Combine different modules or components.
4. **Bug Fixing** – Identify and correct errors.
5. **Documentation** – Prepare technical and user documents.
6. **Review** – Check whether the developed project meets the requirements.

In short: Planning tells *what to build*, while the development phase is where the project is **actually created and tested**.
